

ROOT Summer Student Course

B. Bellenot, J. López, L. Moneta, A. Naumann, J. Rembser, E. Tejedor
for the ROOT Team

ROOT
Data Analysis Framework
<https://root.cern>

Agenda and exercises

- ▶ <https://indico.cern.ch/event/1159429/>

Make Sure One of These Works for You!

► On Lxplus

- ssh -XY <username>@lxplus.cern.ch
- source /cvmfs/sft.cern.ch/lcg/views/LCG_101/x86_64-centos7-gcc8-opt/setup.sh

► On SWAN: <https://swan.cern.ch>

- The Jupyter Notebook service of CERN
- IMPORTANT: first visit <https://cernbox.cern.ch>

► On your machine (Linux or Mac)

- Compiled by yourself from sources
- Using the binaries we distribute
- See <https://root.cern/releases>

Note: ROOT on Windows might not have support for some features.

Introduction

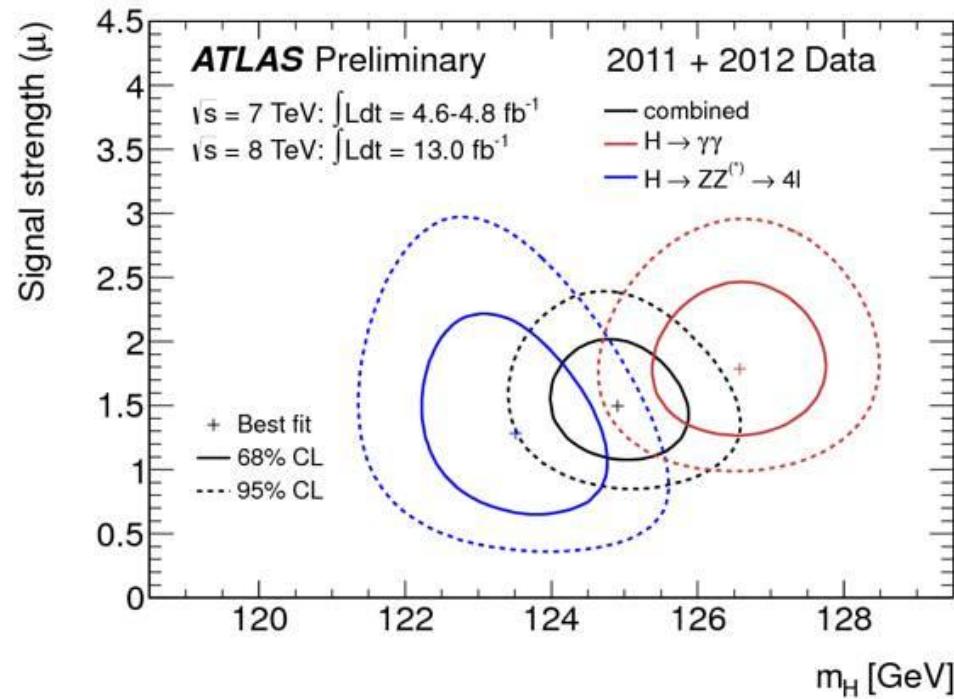

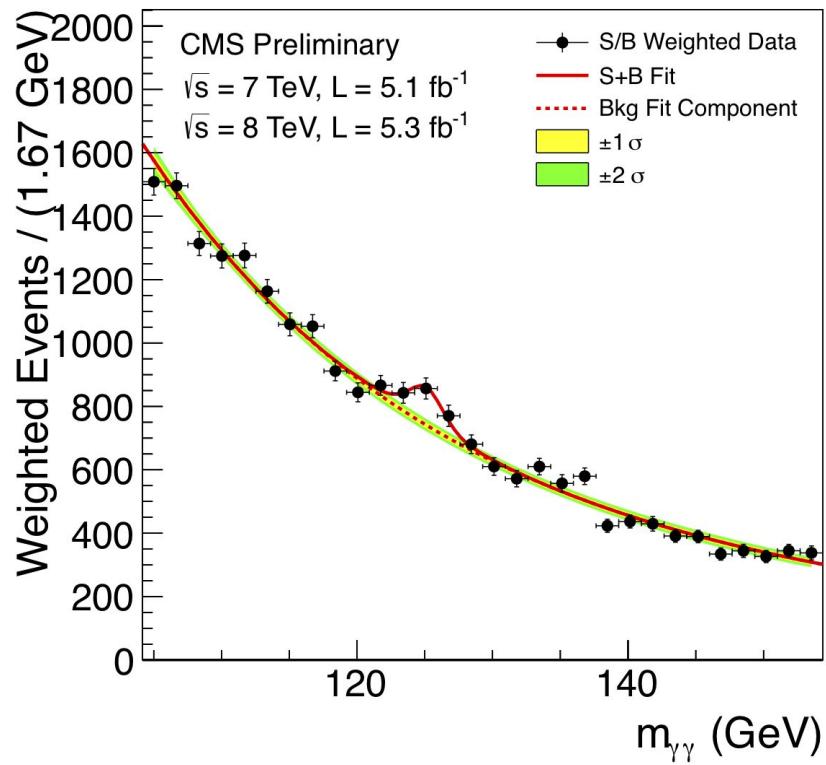

A Quick Tour of ROOT

What can you do with ROOT?

ROOT in a Nutshell

ROOT can be seen as a collection of building blocks for various activities, like:

- ▶ **Data analysis: histograms, graphs, functions**
- ▶ **I/O: row-wise, column-wise** storage of any C++ object
- ▶ **Statistical tools** (RooFit/RooStats): rich modeling and statistical inference
- ▶ Math: **non-trivial functions** (e.g. Erf, Bessel), optimised math functions
- ▶ **C++ interpretation**: full language compliance
- ▶ **Multivariate Analysis** (TMVA): e.g. Boosted decision trees, Neural Nets
- ▶ **Advanced graphics** (2D, 3D, event display)
- ▶ **Declarative Analysis**: RDataFrame
- ▶ And more: HTTP servering, JavaScript visualisation

- ▶ ROOT web site: **the** source of information for ROOT users
 - For beginners and experts
 - Downloads, installation instructions
 - Documentation of all ROOT classes
 - Manuals, tutorials, presentations
 - Forum
 - ...

The screenshot shows the official ROOT website at https://root.cern. At the top, there's a navigation bar with links for About, Install, Get Started, Forum & Help, Manual, Blog Posts, Contribute, and For Developers. A search icon is also present. Below the header, a large banner features the text "ROOT: analyzing petabytes of data, scientifically." and "An open-source data analysis framework used by high energy physics and others." It includes a "Learn more" button and an "Install v6.26/04" button. To the right of the banner is a 3D visualization of a particle collision event with tracks and energy deposits. Below the banner are four main navigation icons: "Start" (with a computer monitor icon), "Reference" (with a book icon), "Forum" (with a speech bubble icon), and "Gallery" (with a bar chart icon). Further down, there are two sections: one for "ROOT" with a "v-1" icon and another for "Python" with a "\$ _" icon. Both sections provide brief descriptions of the software's capabilities.

ROOT
Data Analysis Framework

About Install Get Started Forum & Help Manual Blog Posts Contribute For Developers

ROOT: analyzing petabytes of data, scientifically.

An open-source data analysis framework used by high energy physics and others.

Learn more Install v6.26/04

Start Reference Forum Gallery

v-1

ROOT enables statistically sound scientific analyses and visualization of large amounts of data: today, more than 1 exabyte (1,000,000,000 gigabyte) are stored in ROOT files. The Higgs was found with ROOT!

\$ _

As high-performance software, ROOT is written mainly in C++. You can use it on Linux, macOS, or Windows; it works out of the box. ROOT is open source: use it freely, modify it, contribute to it!

ROOT comes with an incredible C++ interpreter, ideal for fast prototyping. Don't like C++? ROOT integrates super-smoothly with Python thanks to its unique dynamic and powerful Python \neq C++ binding. Or what about using ROOT in a Jupyter notebook?

Resources

- ▶ ROOT Website: <https://root.cern>
- ▶ Training: <https://github.com/root-project/training>
- ▶ More material: [https://root.cern/get started](https://root.cern/get_started)
 - Includes a booklet for beginners: **the "ROOT Primer"**
- ▶ Reference Guide:
<https://root.cern/doc/master/index.html>
- ▶ Forum: <https://root-forum.cern.ch>

Expert Level

- ▶ Get the ROOT sources:
 - *git clone <http://github.com/root-project/root>*
 - *Or visit <https://root.cern.ch/content/release-62406>*
- ▶ Create a build directory and configure ROOT:
 - *mkdir rootBuild; cd rootBuild*
 - *cmake .. /root*
 - <https://root.cern.ch/building-root> for all the config options
- ▶ Start compilation
 - *make -j*
- ▶ Prepare environment:
 - *. bin/thisroot.sh*

The ROOT Prompt and Macros

The ROOT Prompt

- ▶ C++ is a compiled language
 - A compiler is used to translate source code into machine instructions
- ▶ ROOT provides a C++ **interpreter**
 - Interactive C++, without the need of a compiler, like Python, Ruby, Haskell ...
 - Code is **Just-in-Time compiled!**
 - Allows reflection (inspect layout of classes at runtime)
 - Is started with the command:

root

- The interactive shell is also called "ROOT prompt" or "ROOT interactive prompt"

ROOT As a Calculator

$$\frac{1}{1-x} = 1 + x + x^2 + x^3 + x^4 + \dots$$
$$= \sum_{n=0}^{\infty} x^n$$

Here we make a step forward.
We declare **variables** and use a *for* control structure.

```
root [0] double x=.5
(double) 0.5
root [1] int N=30
(int) 30
root [2] double gs=0;
```

```
root [3] for (int i=0;i<N;++i) gs += pow(x,i)
root [4] std::abs(gs - (1/(1-x)))
(Double_t) 1.86265e-09
```

Controlling ROOT

- ▶ Special commands which are not C++ can be typed at the prompt, they start with a ":"

```
root [1] .<command>
```

- ▶ For example:
 - To quit root use **.q**
 - To issue a shell command use **.! <OS_command>**
 - To load a macro use **.L <file_name>** (see following slides about macros)
 - **.help** or **.?** gives the full list

Ex Tempore Exercise

- ▶ Fire up ROOT
- ▶ Verify it works as a calculator
- ▶ List the files in /etc from within the ROOT prompt
- ▶ Inspect the help
- ▶ Quit

Interactivity

```
root [0] #include "a.h"
root [1] A o("ThisName"); o.printName()
ThisName
root [1] dummy()
(int) 42
```

a.h

```
# include <iostream>
class A {
public:
    A(const char* n) : m_name(n) {}
    void printName() { std::cout << m_name << std::endl; }
private:
    const std::string m_name;
};

int dummy() { return 42; }
```

ROOT Macros

- ▶ We have seen how to interactively type lines at the prompt
- ▶ The next step is to write "ROOT Macros" – lightweight programs
- ▶ The general structure for a macro stored in file *MacroName.C* is:

Function, no main, same
name as the file

```
void MacroName() {  
    <           ...  
                your lines of C++ code  
    ...           >  
}
```

Unnamed ROOT Macros

- ▶ Macros can also be defined with no name
- ▶ Cannot be called as functions!
 - See next slide :)

```
{  
    <           ...  
    your lines of C++ code  
    ...           >  
}
```

Running a Macro

- ▶ A macro is executed at the system prompt by typing:

```
> root MacroName.C
```

- ▶ or executed at the ROOT prompt using .x:

```
> root  
root [0] .x MacroName.C
```

- ▶ or it can be loaded into a ROOT session and then be run by typing:

```
root [0] .L MacroName.C  
root [1] MacroName();
```

Interpretation and Compilation

- ▶ We have seen how ROOT interprets and "just in time compiles" code. ROOT also allows to compile code "traditionally". At the ROOT prompt:

```
root [1] .L macro1.C+
root [2] macro1()
```

Generate shared library
and execute function

- ▶ ROOT libraries can also be used to produce standalone, compiled applications:

Advanced Users

```
int main() {
    ExampleMacro();
    return 0;
}
```

```
> g++ -o ExampleMacro ExampleMacro.C `root-config --cflags --libs`  
> ./ExampleMacro
```

Time For Exercises

► Exercises:

<https://github.com/root-project/training/tree/master/SummerStudentCourse/2022/Exercises/C%2B%2BInterpreter>

The ROOTBooks

The Jupyter Notebook

A web-based interactive computing platform that combines code, equations, text and visualisations.

Many supported languages: C++, Python, Haskell, Julia...
One generally speaks about a "kernel" for a specific language

In a nutshell: an "interactive shell opened within the browser"

<http://www.jupyter.org>

How It Looks Like

Text

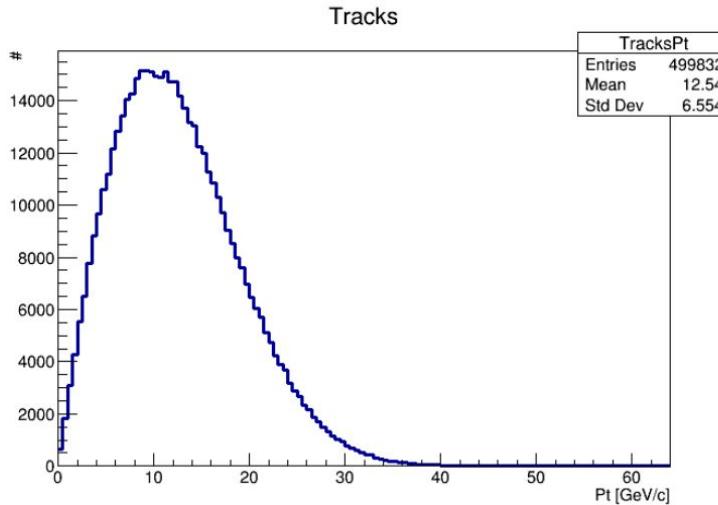

Access TTree in Python using PyROOT and fill a histogram

Loop over the TTree called "events" in a file located on the web. The tree is accessed with the dot operator. Same holds for the access to the branches: no need to set them up - they are just accessed by name, again with the dot operator.

```
In [1]: import ROOT  
  
f = ROOT.TFile.Open("http://indico.cern.ch/event/395198/material/0/0.root");  
h = ROOT.TH1F("TracksPt","Tracks;Pt [GeV/c];#",128,0,64)  
for event in f.events:  
    for track in event.tracks:  
        h.Fill(track.Pt())  
c = ROOT.TCanvas()  
h.Draw()  
c.Draw()
```

Code

Graphics

Use Notebooks at CERN

- ▶ **SWAN:** Service for Web based **AN**alysis
- ▶ Get a CERNBox (if you don't have one)
 - Visit <https://cernbox.cern.ch>
- ▶ Log in to <https://swan.cern.ch>
- ▶ Create a project and a C++ notebook
 - Type in some code
 - Run it
 - Create markdown cells
 - Rerun cells with definitions

Notebooks On Your Machine

- ▶ Possible to install Jupyter as a package
- ▶ Fire up with the *root --notebook* command

Examples

Open the gallery section in SWAN!

The screenshot shows a browser window with the URL <https://swan002.cern.ch/user/etejedor/gallery/>. The page title is "SWAN > Gallery > Basic Examples". The main content area is titled "Gallery" and lists several categories: "Basic Examples", "ROOT Primer", "Accelerator Complex", "FCC", "Beam Dynamics", "Machine Learning", "Apache Spark", and "Outreach". A large blue arrow points from the magnifying glass icon in the SWAN interface to this list.

SWAN > Gallery > Basic Examples

Gallery

- > [Basic Examples](#)
- > [ROOT Primer](#)
- > [Accelerator Complex](#)
- > [FCC](#)
- > [Beam Dynamics](#)
- > [Machine Learning](#)
- > [Apache Spark](#)
- > [Outreach](#)

Basic Examples

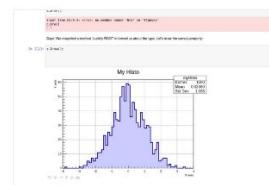

This is a gallery of basic example notebooks: click on the images to inspect the underlying document, open in SWAN the single notebooks or the full git repository!

Many of the notebooks are ROOTbooks, based on the ROOT framework. To know more about ROOT, visit root.cern.ch.

Simple ROOTbook (Python)

Simple ROOTbook (C++)

Histograms, Graphs and Functions

Histograms

- ▶ A simple form of data reduction
 - Can have billions of collisions, the Physics displayed in a few histograms
 - It is like an empirical density estimator
 - Possible to calculate momenta: mean, rms, skewness, kurtosis ...
- ▶ Collect quantities in discrete categories, the bins
- ▶ ROOT Provides a rich set of histograms
 - In multiple dimensions: $TH\{1,2,3\}$ classes + THN
 - Holding different precision types
 - $TH1D$ is a one-dim histogram holding doubles
 - Have also $TH\{1,2,3\}F$ (float), I (int32), S (int16), C (int8)

My First Histogram

```
root [0] TH1D h("myHist", "myTitle", 64, -4, 4)
root [1] h.Draw()
```

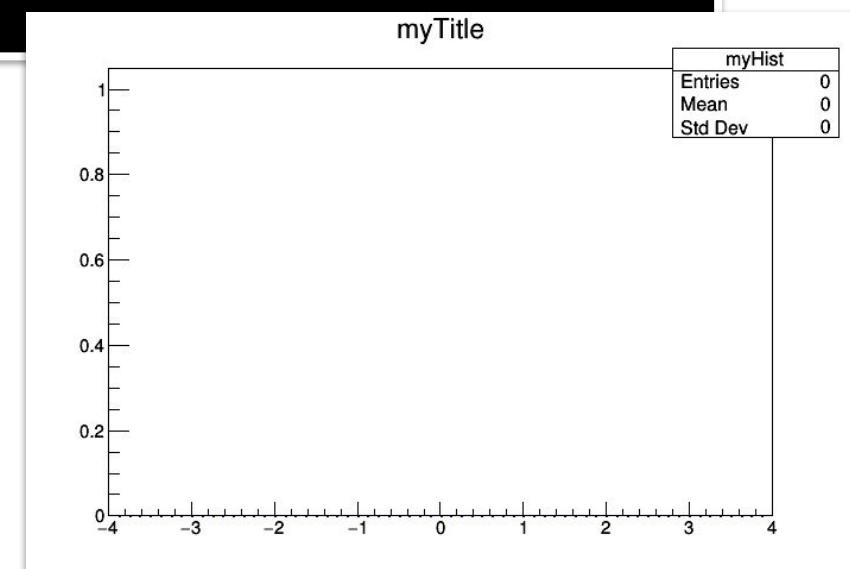

Note that in **Jupyter notebooks** (also in **SWAN**),
the figure is not shown directly. You have to:

1. Either call `gPad->Draw()` at the end:

```
In [1]: TH1D h("myHist", "myTitle", 64, -4, 4);
          h.Draw();
          gPad->Draw();
```

2. Or you can create a `TCanvas` and draw it:

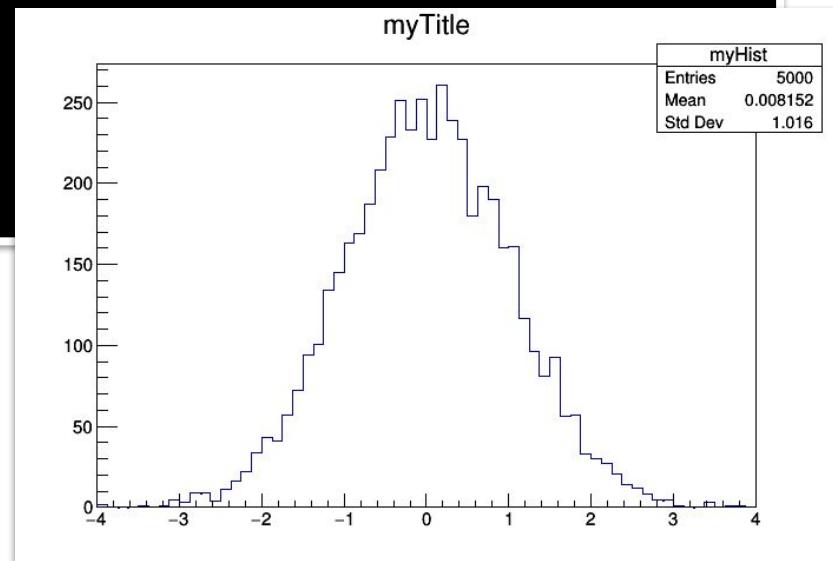

```
In [2]: TCanvas c1;
          TH1D h("myHist", "myTitle", 64, -4, 4);
          h.Draw();
          c1.Draw();
```

My First Histogram

```
root [0] TH1D h("myHist", "myTitle", 64, -4, 4)
root [1] h.FillRandom("gaus")
root [2] h.Draw()
```

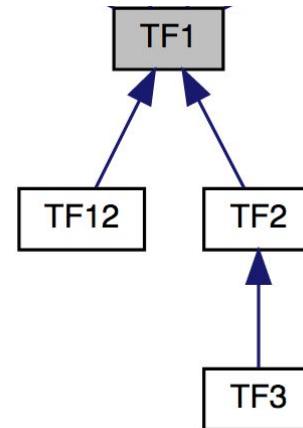

- ▶ Mathematical functions are represented by the **TF1** class
- ▶ They have names, formulas, line properties, can be evaluated as well as their integrals and derivatives
 - Numerical techniques for generic cases
 - Automatic differentiation can be used for derivatives

option	description
"SAME"	superimpose on top of existing picture
"L"	connect all computed points with a straight line
"C"	connect all computed points with a smooth curve
"FC"	draw a fill area below a smooth curve

From the TGraphPainter documentation:

<https://root.cern.ch/doc/master/classTGraphPainter.html>

Functions

Can describe functions as:

- ▶ Mathematical formulas (written as strings)
- ▶ C++ functions/functors/lambdas
 - Implement your highly performant custom function
- ▶ Python functions
 - Fast prototyping on the Python side
- ▶ With and without parameters
 - Crucial for fits and parameter estimation

ROOT as a Function Plotter

- ▶ The class TF1 represents one-dimensional functions (e.g. $f(x)$):

```
root [0] TF1 f1("f1","sin(x)/x",0.,10.); //name,formula,min,max  
root [1] f1.Draw();
```

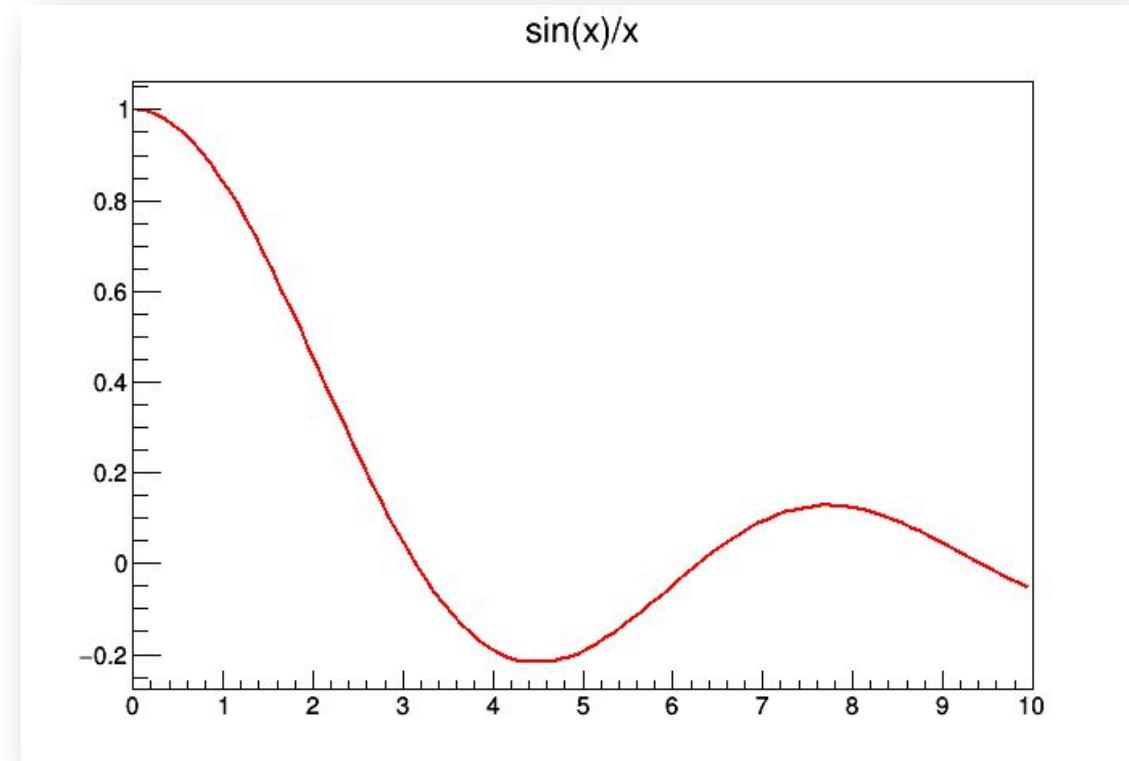

- ▶ An extended version of this example is the definition of a function with parameters:

```
root [2] TF1 f2("f2","[0]*sin([1]*x)/x",0.,10.);  
root [3] f2.SetParameters(1,1);  
root [4] f2.Draw();
```

Try it!

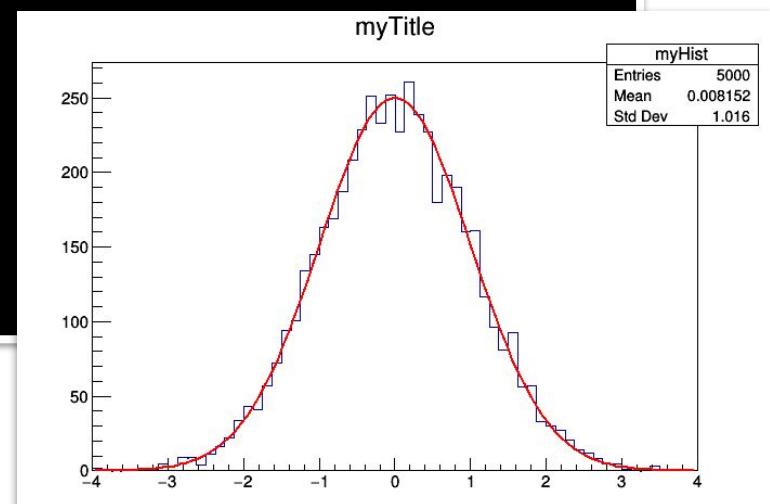

ROOT as a Function Plotter

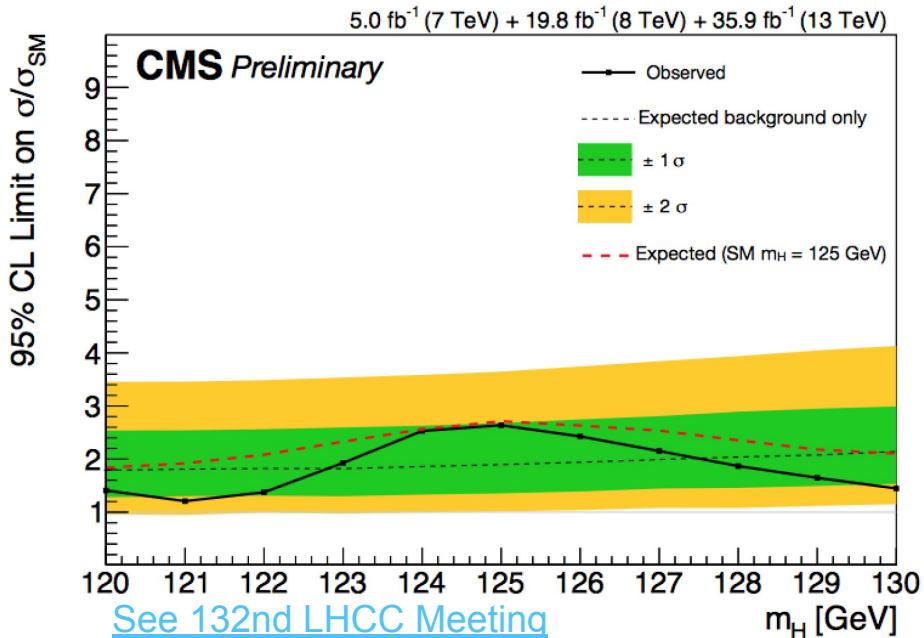

Another Example

```
root [0] TH1D h("myHist", "myTitle", 64, -4, 4)
root [1] h.FillRandom("gaus")
root [2] h.Draw()
root [3] TF1 f("g", "gaus", -8, 8)
root [4] f.SetParameters(250, 0, 1)
root [5] f.Draw("Same")
```

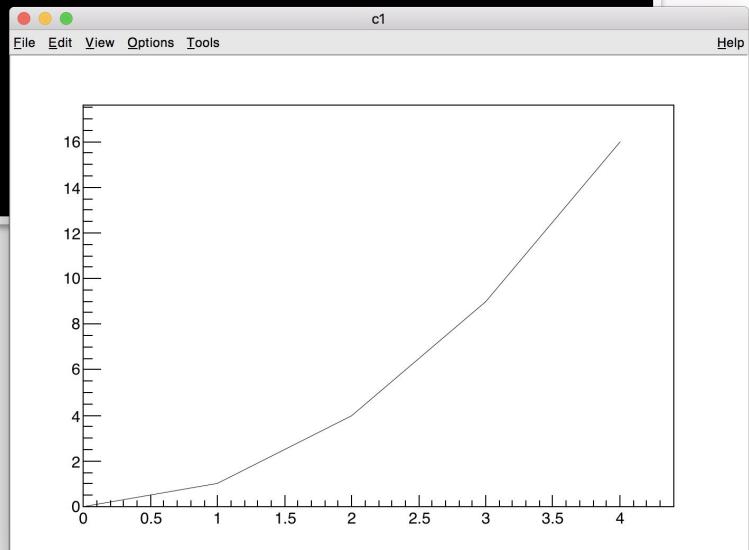

- ▶ Display points and errors
- ▶ Not possible to calculate momenta
- ▶ Not a data reduction mechanism
- ▶ **Fundamental to display trends**

My First Graph

```
root [0] TGraph g;
root [1] for (auto i : {0,1,2,3,4}) g.SetPoint(i,i,i*i)
root [2] g.Draw("APL")
```

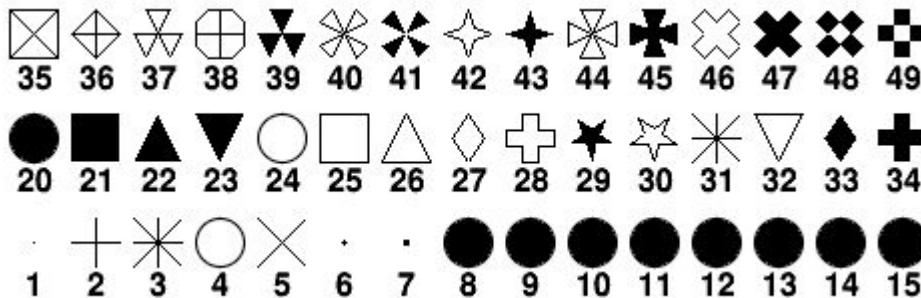

Creating a Nice Plot: Survival Kit

The Markers

From the TAttMarker documentation:

<https://root.cern.ch/doc/master/classTAttMarker.html>

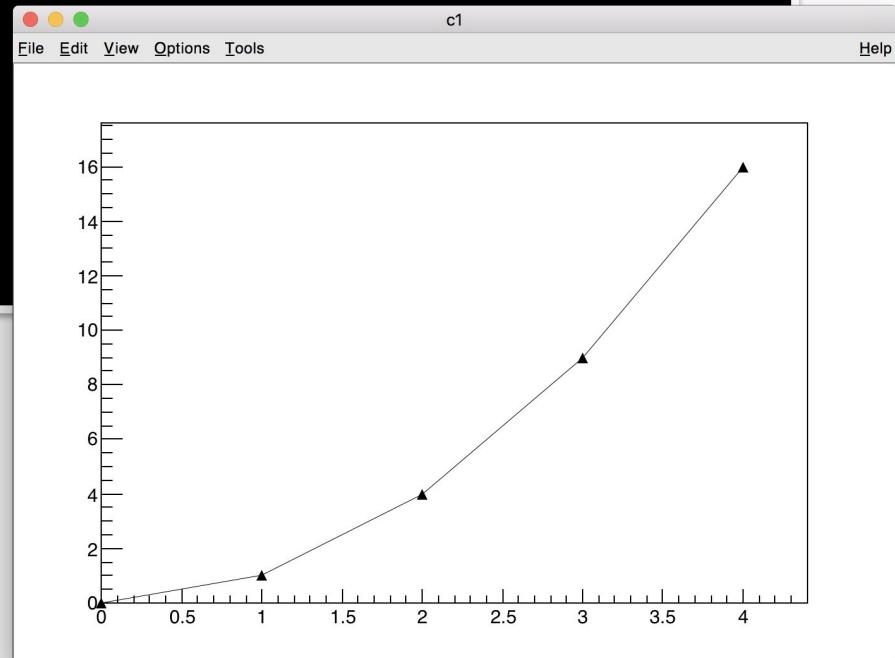

```
kDot=1, kPlus, kStar, kCircle=4, kMultiply=5,  
kFullDotSmall=6, kFullDotMedium=7, kFullDotLarge=8,  
kFullCircle=20, kFullSquare=21, kFullTriangleUp=22,  
kFullTriangleDown=23, kOpenCircle=24, kOpenSquare=25,  
kOpenTriangleUp=26, kOpenDiamond=27, kOpenCross=28,  
kFullStar=29, kOpenStar=30, kOpenTriangleDown=32,  
kFullDiamond=33, kFullCross=34 etc...
```

Also available
through more friendly
names 😊

My First Graph

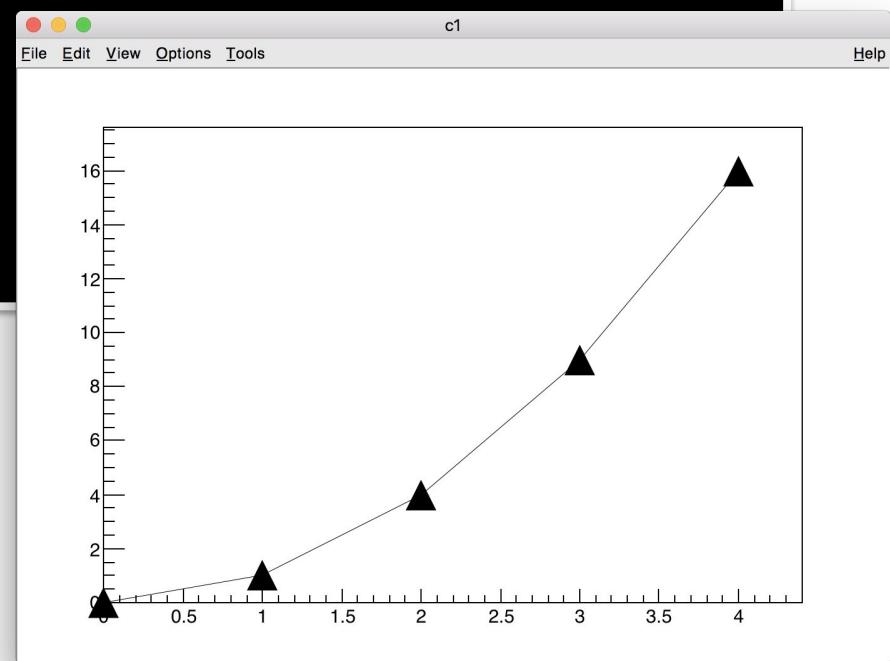

```
root [3] g.SetMarkerStyle(kFullTriangleUp)
```

My First Graph

```
root [3] g.SetMarkerStyle(kFullTriangleUp)
root [4] g.SetMarkerSize(3)
```

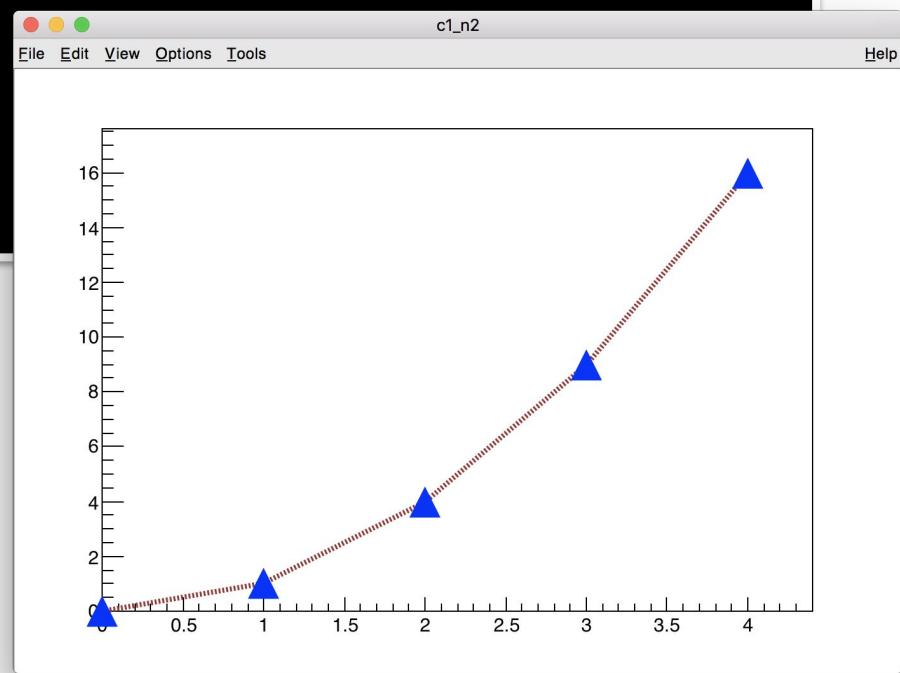

My First Graph

```
root [5] g.SetMarkerColor(kAzure)
root [6] g.SetLineColor(kRed - 2)
root [7] g.SetLineWidth(2)
root [8] g.SetLineStyle(3)
```

Question:

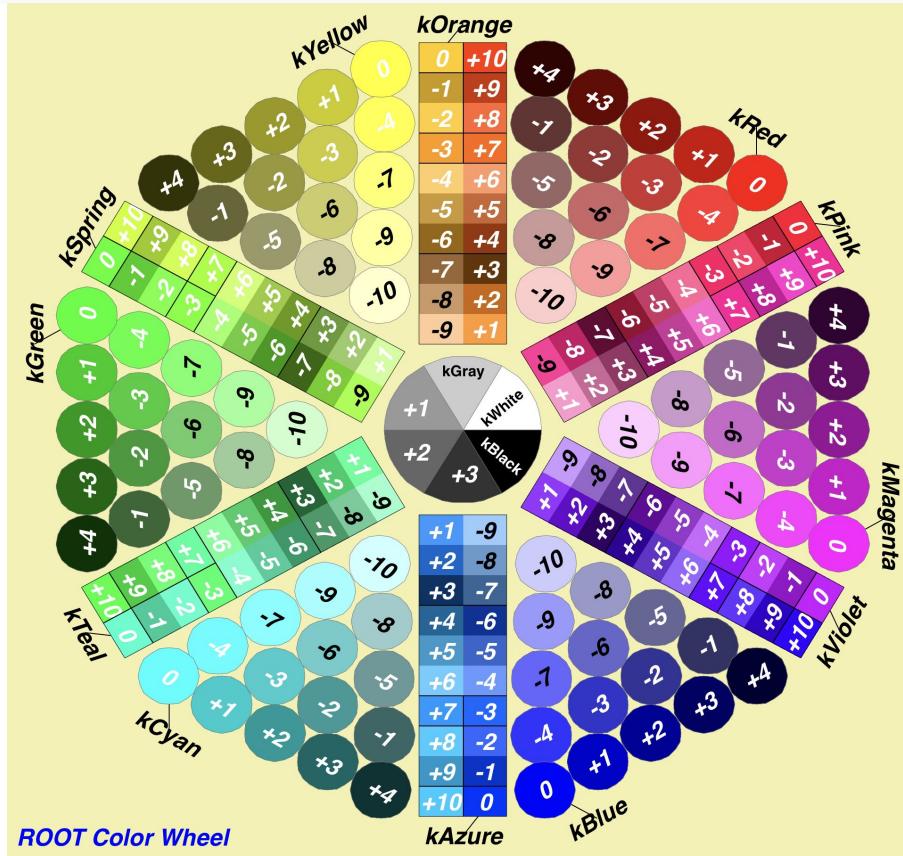

How do you find information
on line styles?

See [TAttLine documentation](#)

The Colors (TColorWheel)

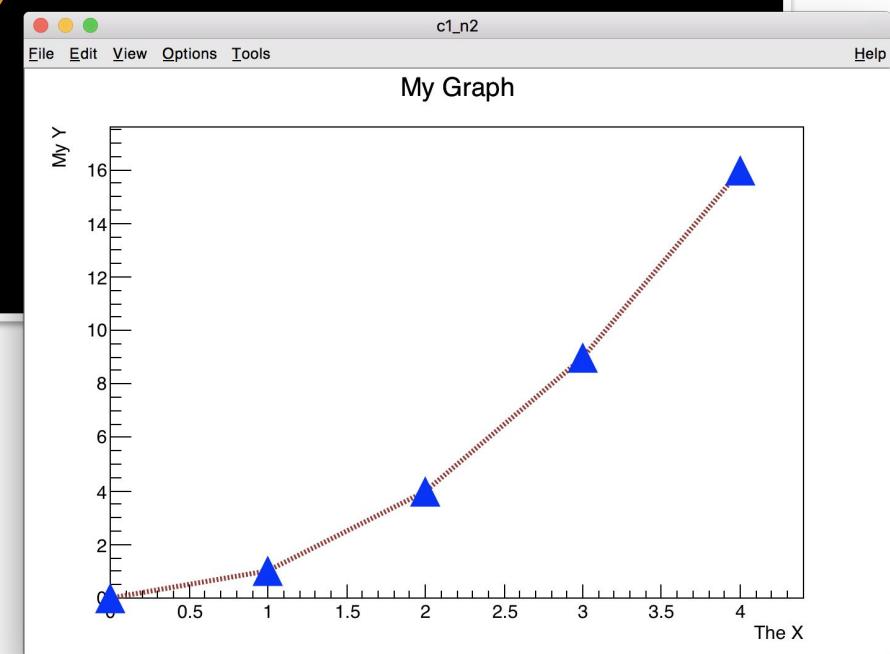

My First Graph

```
root [9] g.SetTitle("My Graph;The X;My Y")
```

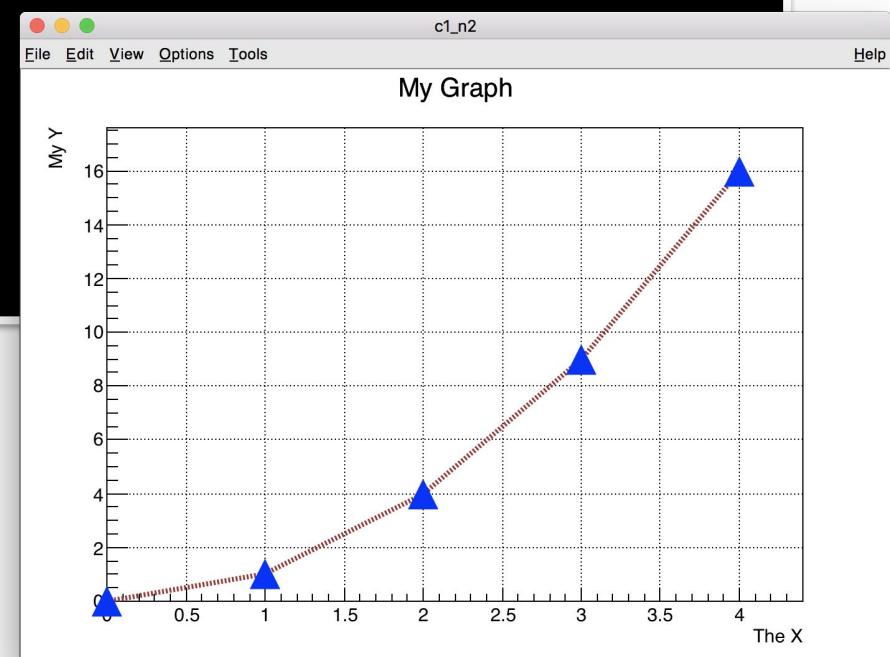

Shortcut:
Directly set titles for x
and y axis.

My First Graph

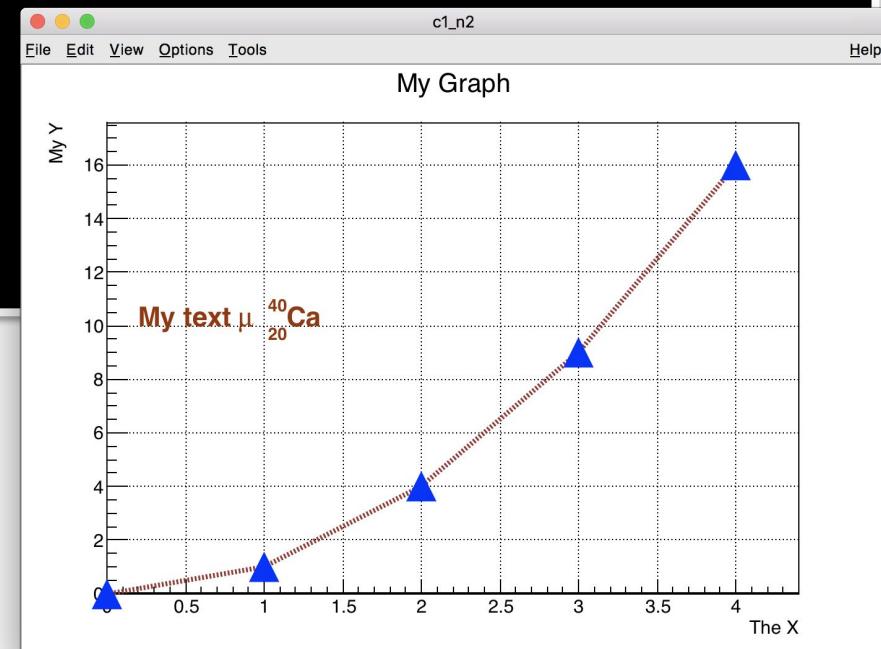

```
root [10] gPad->SetGrid()
```

My First Graph

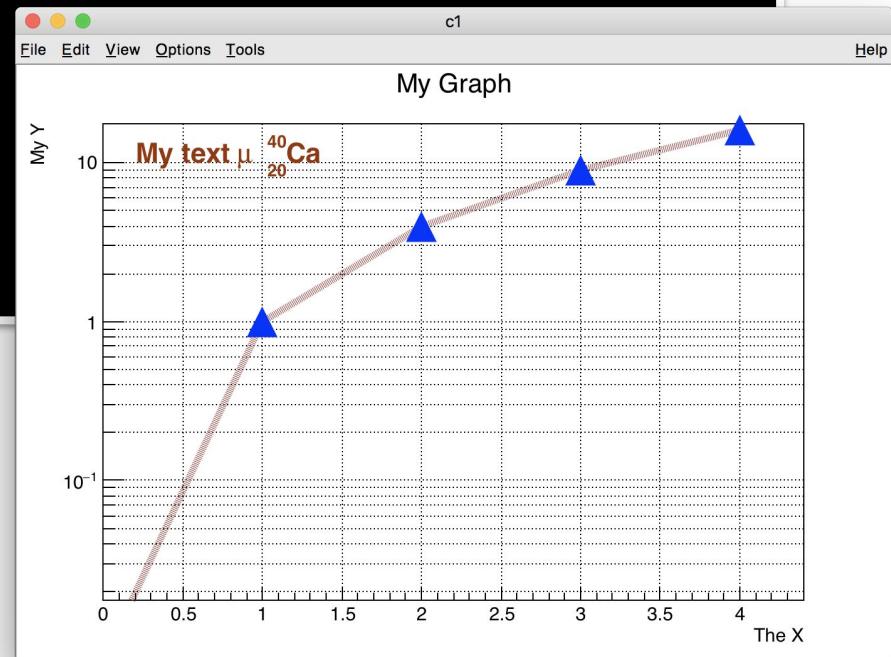

```
root [10] auto txt = "#color[804]{My text #mu }^{40}_{20}Ca"
root [11] TLatex l(.2, 10, txt)
root [12] l.Draw()
```

My First Graph

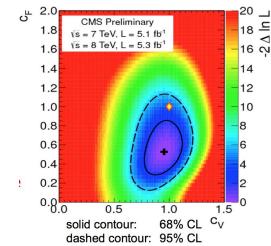

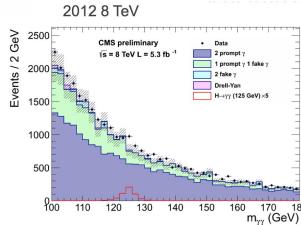

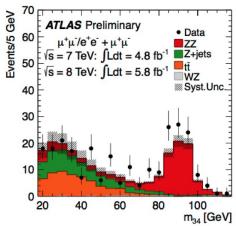

```
root [13] gPad->SetLogy();
```

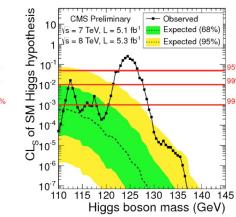

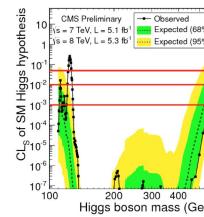

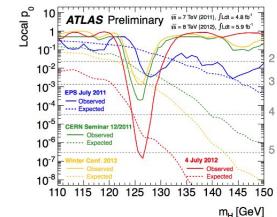

Drawing Options Documentation

- ▶ See the documentation of the [THistPainter](#) class for all possible options on drawing histograms

- ▶ See the documentation of [TGraphPainter](#) for the Graph drawing options

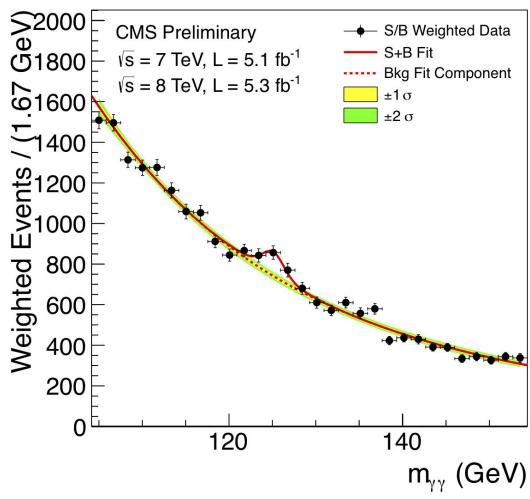

Time for Exercises!

<https://github.com/root-project/training/tree/master/SummerStudentCourse/2022/Exercises/HistogramsGraphsFunctions>

Parameter Estimation and Fitting

What is Fitting ?

- ▶ Estimate parameters of a hypothetical distribution from the observed data distribution
 - $y = f(x | \theta)$ is the fit model function
- ▶ Find the best estimate of the parameters θ assuming $f(x | \theta)$
- ▶ Both Likelihood and Chi2 fitting are supported in ROOT

Example

Higgs $\rightarrow \gamma\gamma$ spectrum

We can fit for:

- the expected number of Higgs events
- the Higgs mass

Fitting in ROOT:

- ▶ Create first a parametric function object, **TF1**, which represents our model
 - need to set the initial values of the function parameters.
- ▶ Fit the data object (Histogram or Graph):
 - Call the **Fit** method passing the function object
 - various options are possible (see the [**TH1::Fit**](#) documentation)
- ▶ Examine result:
 - get parameter values, uncertainties, correlation
 - get fit quality estimation
- ▶ The resulting fit function is also drawn automatically on top of the Histogram or the Graph when calling **TH1::Fit** or **TGraph::Fit**

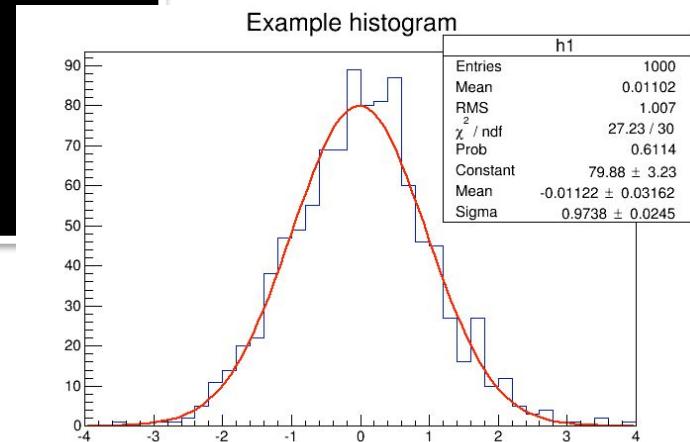

Fitting Histograms

- We have a histogram, $h1$, and we want to fit it:

```
root [0] TF1 f1("f1","gaus");  
root [1] h1.Fit(&f1);
```

```
FCN=27.2252 FROM MIGRAD      STATUS=CONVERGED          60 CALLS          61 TOTAL  
                           EDM=1.12393e-07   STRATEGY= 1    ERROR MATRIX ACCURATE
```

EXT PARAMETER		STEP		FIRST	
NO.	NAME	VALUE	ERROR	SIZE	DERIVATIVE
1	Constant	7.98760e+01	3.22882e+00	6.64363e-03	-1.55477e-05
2	Mean	-1.12183e-02	3.16223e-02	8.18642e-05	-1.49026e-02
3	Sigma	9.73840e-01	2.44738e-02	1.69250e-05	-5.41154e-03

For displaying the fit parameters:

```
gStyle->SetOptFit(1111);
```

Creating the Fit Function

- ▶ How to create the parametric function object (**TF1**) :
 - we can write formula expressions using functions:

```
TF1 f1 ("f1", "[0]*TMath::Gaus(x,[1],[2])");
```

- we can use the available functions in ROOT library and stl
- **[0],[1],[2] indicate the parameters.**
- We could also use meaningful names, like [a],[mean],[sigma]
- There are pre-defined functions

```
TF1 ("f1", "gaus");
```

- pre-defined functions available: *gaus, expo, landau, breitwigner, crystal_ball, pol{0,1..N}, cheb{0,1,...10}, xygaus,, bigaus*
 - ◆ see full list in the documentation of [TH1::Fit\(\)](#), and also in the [ROOT reference doc](#) for TFormula

Building More Complex Functions

- ▶ Any C++ object (functor) implementing

```
double operator() (double *x, double *p)
```

```
struct Function {  
    double operator() (double *x, double *p){  
        return p[0]*TMath::Gaus(x[0],p[1],p[2]);  
    }  
};  
  
Function f;  
TF1 f1("f1",f,xmin,xmax,npar);
```

- also a lambda function (with Cling and C++-11)

```
TF1 f1("f1", [] (double *x, double *p){return p[0]*x[0];},0,10,1);
```

a lambda can be used also as a string expression, which will be JIT'ed by CLING

```
TF1 f1("f1", "[ ] (double *x, double *p){return p[0]*x[0];}",0,10,1);
```

Functionality provided by TFormula

TFormula is based on Cling. Additional functionality provided:

- ▶ better parameter definition
 - `TF1("f1","gaus(x, [Constant], [Mean], [Sigma])");`
- ▶ function composition by concatenating expressions
 - `TF1 fs("sigma","[0]*x+[1]");`
 - `TF1 f1("f1","gaus(x,[C],[Mean],sigma(x,[A],[B]))");`
- ▶ normalized sum for component fitting
 - `TF1 model("model","NSUM(expo, gaus)");`
- ▶ convolutions
 - `TF1 voigt("voigt", "CONV(breitwiegner, gaus)", xmin, xmax);`
- ▶ can define vectorized functions for faster fitting and evaluation
 - see [vectorizedFit](#) tutorial
- ▶ support for auto-differentiation (automatic generation of gradient and Hessian)

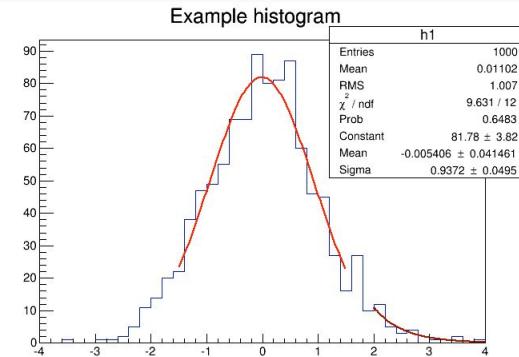

Fitting Options

- ▶ Likelihood fit for histograms
 - option "L" for count histograms; `h1->Fit("gaus","L");`
 - option "WL" in case of weighted counts. `h1->Fit("gaus","LW");`
- ▶ Default is chi-square with observed errors (and skipping empty bins)
 - option "P" for Pearson chi-square expected errors, and including empty bins `h1->Fit("gaus","P");`
- ▶ Use integral function of the function in bin `h1->Fit("gaus","L I");`
- ▶ Compute MINOS errors : option "E" `h1->Fit("gaus","L E");`

Some More Fitting Options

- ▶ Fitting in a Range
 - `h1->Fit("gaus","","",-1.5,1.5);`
- ▶ For doing several fits
 - `h1->Fit("expo","+", "",2.,4);`
- ▶ Quiet / Verbose: option "Q"/"V"
 - `h1->Fit("gaus","V");`
- ▶ Avoid storing and drawing fit function (useful when fitting many times)
 - `h1->Fit("gaus","L N 0");`
- ▶ Save result of the fit, option "S"
 - `auto result = h1->Fit("gaus","L S");
result->Print("V");`

Minimization

- ▶ The fit is done by minimizing the least-square or likelihood function.
- ▶ A direct solution exists only in case of linear fitting
 - it is done automatically in such cases (e.g fitting polynomials).
- ▶ Otherwise an iterative algorithm is used:
 - Minuit is the minimization algorithm used by default
 - ROOT provides two implementations: Minuit and Minuit2
 - other algorithms exists: Fumili, or minimizers based on GSL, genetic and simulated annealing algorithms
 - To change the minimizer:

```
ROOT::Math::MinimizerOptions::SetDefaultMinimizer("Minuit2");
```
 - Other commands are also available to control the minimization:

```
ROOT::Math::MinimizerOptions::SetDefaultTolerance(1.E-6);
```

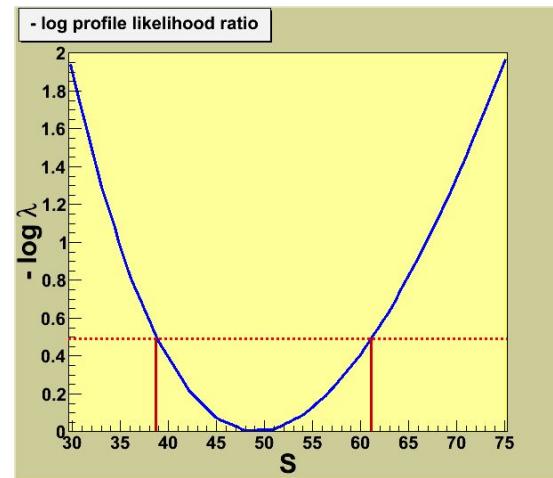

Parameter Errors

Errors returned by the fit are computed from the second derivatives of the log-likelihood function

- Assume the negative log-likelihood function is a parabola around minimum
- This is true asymptotically and in this case the parameter estimates are also normally distributed.
- The estimated correlation matrix is then:

$$\hat{\mathbf{V}}(\hat{\boldsymbol{\theta}}) = \left[\left(-\frac{\partial^2 \ln L(\mathbf{x}; \boldsymbol{\theta})}{\partial^2 \boldsymbol{\theta}} \right)_{\boldsymbol{\theta}=\hat{\boldsymbol{\theta}}} \right]^{-1} = \mathbf{H}^{-1}$$

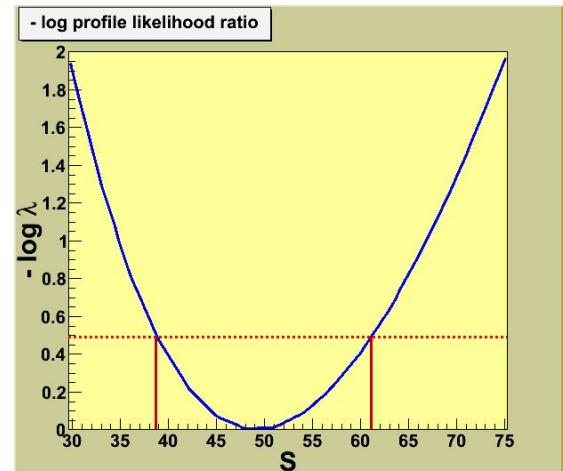

Parameter Errors

- ▶ A better approximation to estimate the confidence level of the parameter is to use directly the log-likelihood function and look at the difference from the minimum.
 - Method of Minuit/Minos (Fit option "E")
 - obtain a confidence interval which is in general not symmetric around the best parameter estimate

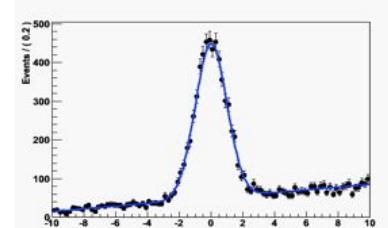

```
auto r = h1->Fit(f1, "E S");
r->LowerError(par_number);
r->UpperError(par_number);
```

RooFit: ROOT toolkit for complex fitting

- ▶ ROOT fitting can handle complicated functions...
 - ...but requires writing much code when fitting using complex models
- ▶ RooFit provides functionality for building fitting models
 - complex model building from standard components
 - composition with addition product and convolution
- ▶ Fitting requires often **Normalization** of pdfs
 - not always trivial to perform and RooFit does it automatically
- ▶ RooFit provides also
 - **MC data generation** from model
 - advance **visualization** of fitting results
 - **simultaneous fit** to different data samples
 - full model description for **reusability**
 - **built-in optimization** for optimal computational performances
 - need to optimize code for acceptable performance in complex fits
- ▶ *For more info see the [manual](#) or the RooFit [courses](#)*

TMVA: Machine Learning in ROOT

- ▶ ROOT ML tools are provided in **TMVA** (*Toolkit for MultiVariate Analysis*)
- ▶ Provides a set of algorithms for standard HEP usage
 - Common interface to different algorithms with consistent evaluation and comparison
 - Capability for classification and regression
 - Embedded in ROOT: **direct connection to input data** (ROOT I/O)
 - Most popular algorithms are BDT and ANN (supporting recently some DL tools)
- ▶ Interfaces to external ML library :
 - e.g. to Python tools: scikit-learn, Tensorflow/Keras, PyTorch
- ▶ Fast inference system for Deep Learning models (SOFIE) and BDT
 - new tool to generate code and easily evaluate ML models in ROOT that can be trained with other tools (e.g Keras, PyTorch) or xgboost
- ▶ *For more info see the [manual](#)*

Time for Exercises!

<https://github.com/root-project/training/tree/master/SummerStudentCourse/2022/Exercises/Fitting>

PyROOT: The ROOT Python Bindings

- ▶ Python bindings for ROOT
- ▶ Access all the ROOT C++ functionality from Python
 - Benefit from C++ performance
- ▶ Dynamic, automatic
- ▶ "Pythonisations" for specific cases

- ▶ Entry point to use ROOT from within Python

```
import ROOT
```

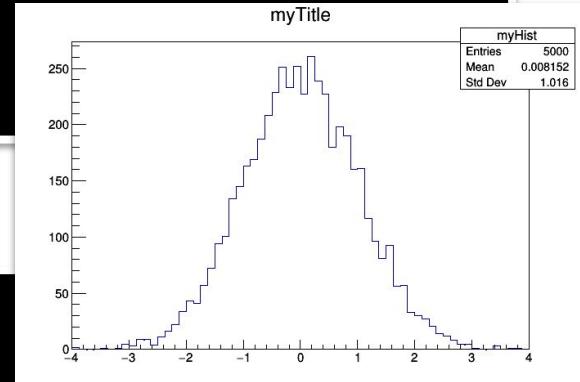

- ▶ All the ROOT classes you have learned so far can be accessed from Python

```
ROOT.TH1F  
ROOT.TGraph  
...
```

Example: C++ to Python

```
> root
root [0] TH1F h("myHist", "myTitle", 64, -4, 4)
root [1] h.FillRandom("gaus")
root [2] h.Draw()
```

```
> python
>>> import ROOT
>>> h = ROOT.TH1F("myHist", "myTitle", 64, -4, 4)
>>> h.FillRandom("gaus")
>>> h.Draw()
```

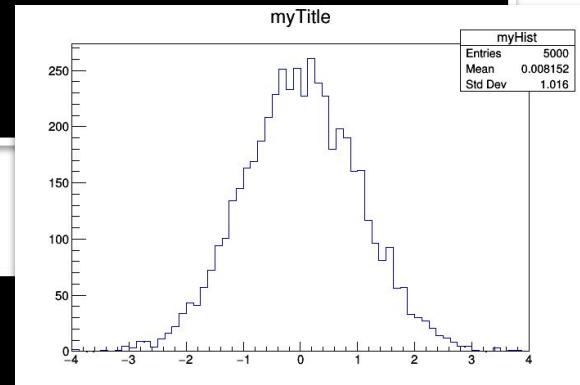

Example: C++ to Python

```
> root
root [0] TH1F h("myHist", "myTitle", 64, -4, 4)
root [1] h.FillRandom("gaus")
root [2] h.Draw()
```

also with
individual import

```
> python
>>> from ROOT import TH1F
>>> h = TH1F("myHist", "myTitle", 64, -4, 4)
>>> h.FillRandom("gaus")
>>> h.Draw()
```

Time For Exercises

<https://github.com/root-project/training/tree/master/SummerStudentCourse/2022/Exercises/PythonInterface>

- ▶ In order to run the exercises:

- Use the Python prompt

```
> python  
>>>
```

- Run a Python script

```
> python -i myscript.py
```

- Use SWAN

- Create a canvas before drawing: `c = ROOT.TCanvas()`
 - Run `c.Draw()` at the end to see the plot

Reading and Writing Data

- ▶ In ROOT, objects are written in files*, represented by **TFile** instances
- ▶ TFiles are *binary* and can be compressed (transparently for the user)
- ▶ **TFiles are self-descriptive:**
 - The information how to retrieve objects from a file is stored with the objects

* this is an understatement - we'll not go into the details in this course!

TFile in Action

```
TFile f("myfile.root", "RECREATE");
```

Option	Description
NEW or CREATE	Create a new file and open it for writing, if the file already exists the file is not opened.
RECREATE	Create a new file, if the file already exists it will be overwritten.
UPDATE	Open an existing file for writing. If no file exists, it is created.
READ	Open an existing file for reading (default).

TFile in Action: Writing

```
TFile f("file.root", "RECREATE");
TH1F h("h", "h", 64, 0, 8);
h.Write("h");
f.Close();
```

- ▶ Write to a file
- ▶ Close the file and make sure the operation succeeded

```
> rootls -l file.root
TH1F Jun 24 15:02 2022 h "h"
```

TFile in Action: Reading

```
TFile f("file.root");
TH1F* h = f.Get<TH1F>("h");
h->Draw();
```

C++

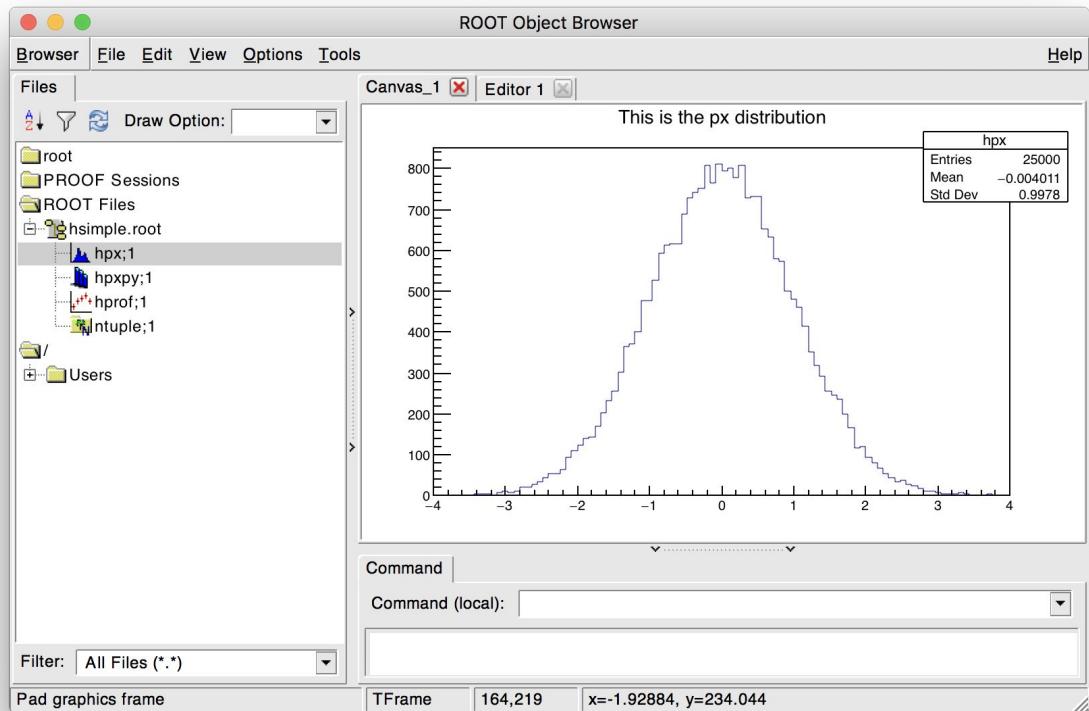

Python

Get the histogram by name!
Possible only in Python

```
import ROOT
f = ROOT.TFile("file.root")
f.h.Draw()
```

Listing TFile Content

- ▶ **TBrowser** interactive tool
 - > root [0] TBrowser t
- ▶ **rootls** tool: list content
- ▶ **TFile::ls()**: prints content
 - Great for interactive usage

Time For Exercises

<https://github.com/root-project/training/tree/master/SummerStudentCourse/2022/Exercises/WorkingWithFiles>

The ROOT Columnar Format

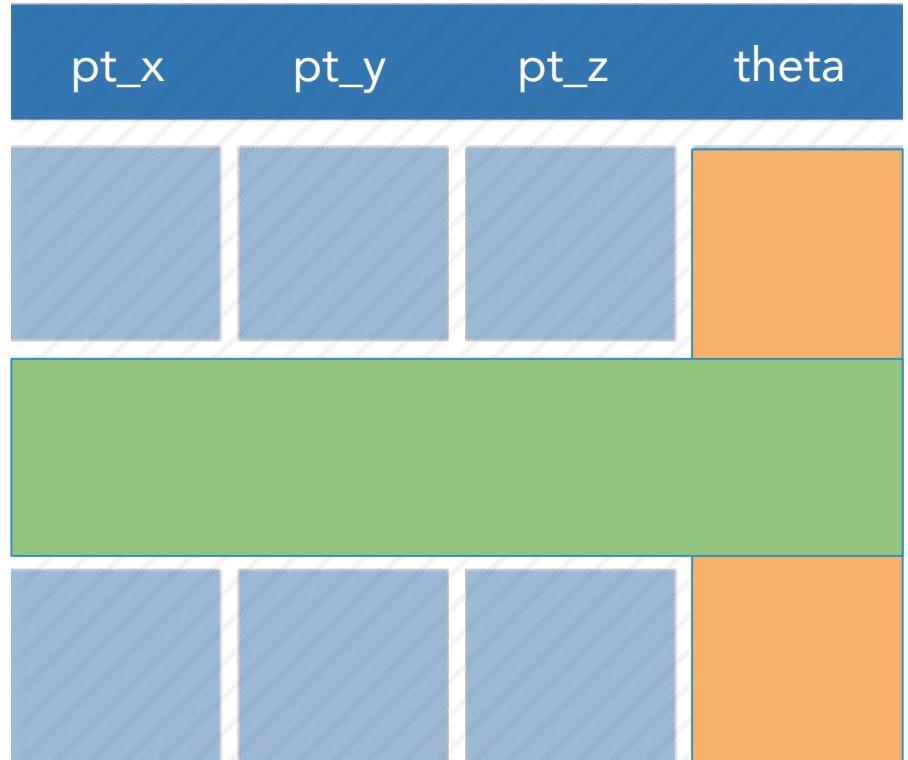

Columns and Rows

- ▶ High Energy Physics: many statistically independent *collision events*
- ▶ Create an event class, serialise and write out N instances into a file?
 - No. Very inefficient!
- ▶ Organise the dataset in **columns**

Columnar Representation

entries
or events →
or rows

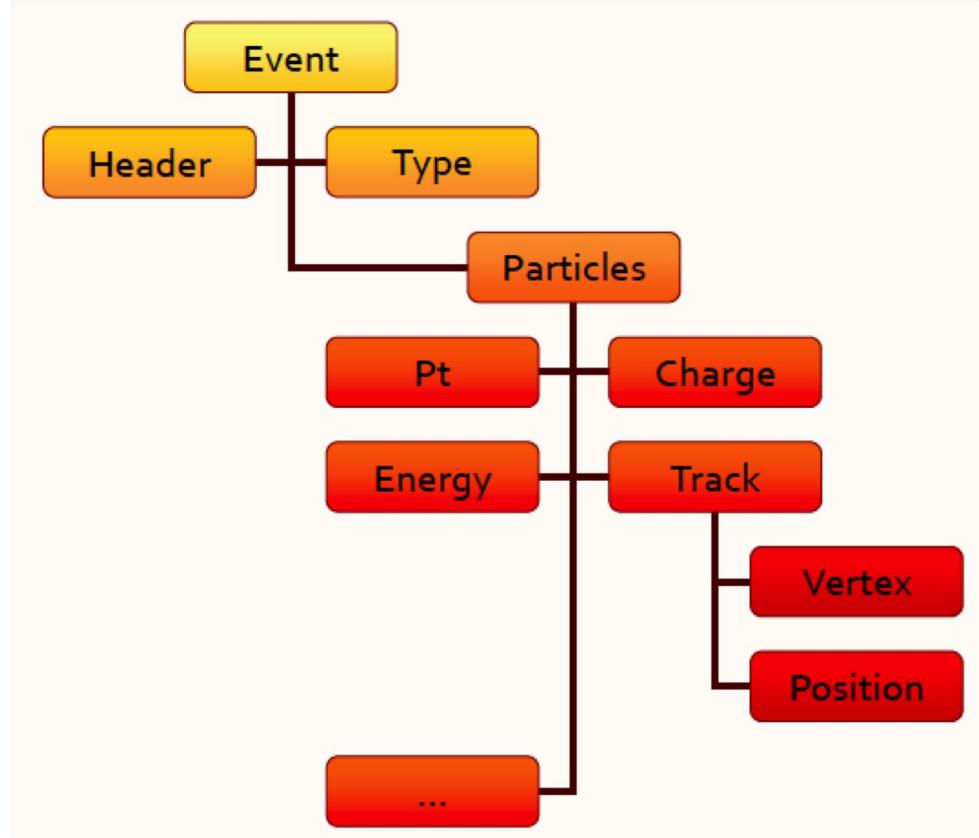

← columns
or "branches"
can contain any kind
of c++ object

Relations Among Columns

x	y	z
-1.10228	-1.79939	4.452822
1.867178	-0.59662	3.842313
-0.52418	1.868521	3.766139
-0.38061	0.969128	1.084074
0.55454	-0.21231	0.50281
-0.184	1.187305	4.443902
0.205643	-0.7701	0.635417
1.079222	0.3219	1.271904
-0.27492	-0.43	3.038899
2.047779	-0.268	4.197329
-0.45868	-0.422	2.293266
0.304731	0.884	0.875442
-0.7122	-0.2223	0.556881
-0.277	1.181767	4.470484
0.86102	-0.65411	1.3209
-2.03555	0.527648	4.421883
-1.45905	-0.464	2.344113
1.230661	-0.00565	1.514559
		3.562347

The TTree

A columnar dataset in ROOT is represented by the class **TTree**:

- ▶ Also called *tree*, columns also called *branches*
- ▶ Columns can contain different types.
- ▶ **Support any type of object**
- ▶ One row per *entry* (or, in collider physics, *event*)

If just a **single number** per column is required, the simpler **TNtuple** can be used.

A modern and simple way to interact with ROOT datasets is to use [RDataFrame](#)

- ▶ Low-level interfaces to deal with datasets do exist but are beyond the scope of this course

RDataFrame: quick how-to

1. build a data-frame object by specifying your data-set
2. apply a series of **transformations** to your data
 - o filter (e.g. apply some cuts) or
 - o define new columns
3. apply **actions** to the transformed data to produce results
(e.g. fill a histogram)

Simple Code Example

1. Build RDataFrame

```
ROOT::RDataFrame d("t", "f.root");
auto h = d.Filter("theta > 0").Histo1D("pt");
h->Draw();
```

2. Cut on
theta

3. Fill histogram
with pt

Filling multiple histograms

```
auto h1 = d.Filter("theta > 0").Histo1D("pt");
auto h2 = d.Filter("theta < 0").Histo1D("pt");
h1->Draw();           // event loop is run lazily once here
h2->Draw("SAME");    // no need to run loop again here
```

Book all your actions upfront. The first time a result is accessed, RDataFrame will fill all booked results.

More on histograms

```
auto h = d.Histo1D({"myName","Title;x",10,0.,1.},  
                    "x");
```

You can specify a model histogram with

- a name and a title
- a predefined axis range

Here, the histogram is created with 10 bins ranging from 0 to 1, and the axis is labelled "x".

Define a new column

```
double m = d.Filter("x > y")
    .Define("z", "sqrt(x*x + y*y)")
    .Mean("z");
```

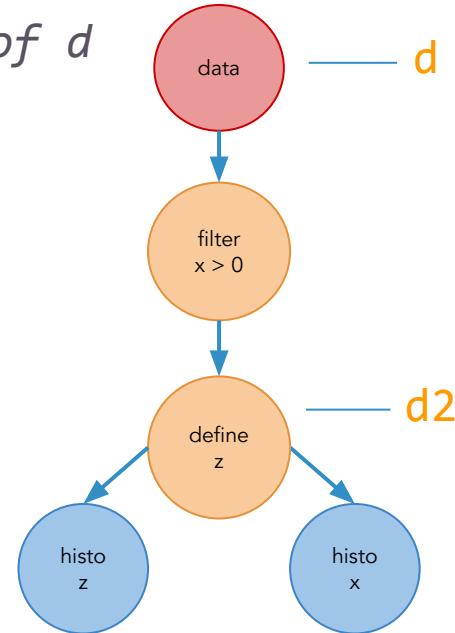

`Define` takes the name of the new column and its expression. Later you can use the new column as if it was present in your data.

Think of your analysis as data-flow

```
// d2 is a new data-frame, a transformed version of d  
auto d2 = d.Filter("x > 0")  
    .Define("z", "x*x + y*y");
```

```
// make multiple histograms out of it  
auto hz = d2.Histo1D("z");  
auto hx = d2.Histo1D("x");
```

You can store transformed data-frames in variables,
then use them as you would use an RDataFrame.

Cutflow reports

```
d.Filter("x > 0", "xcut")
    .Filter("y < 2", "ycut");
d.Report()->Print();
```

```
// output
xcut      : pass=49          all=100        --  49.000 %
ycut      : pass=22          all=49         --  44.898 %
```

When called on the main RDF object, `Report` prints statistics for all filters *with a name*

Saving data to file

```
auto new_df = df.Filter("x > 0")
    .Define("z", "sqrt(x*x + y*y)")
    .Snapshot("tree", "newfile.root");
```

We filter the data, add a new column, and then save everything to file. No boilerplate code at all.

Using callables instead of strings

Expert Feature

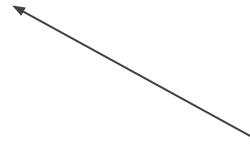

```
// define a c++11 Lambda - an inline function - that checks "x>0"  
auto IsPos = [](double x) { return x > 0.; };  
// pass it to the filter together with a list of branch names  
auto h = d.Filter(IsPos, {"theta"}).Histo1D("pt");  
h->Draw();
```

any callable (function, lambda, functor class) can be used as a filter, as long as it returns a boolean

RDataFrame: declarative analyses

```
ROOT::RDataFrame d("treename", "file.root");
auto h = d.Filter(IsGoodEntry, {"x", "y"})
          .Histo1D("x");
```

- full control over *the analysis*
- no boilerplate
- common tasks are already implemented
- ? parallelization is not trivial?

A function taking 2
values in input, returns
a boolean

RDataFrame: parallelism

```
ROOT::EnableImplicitMT();  
ROOT::RDataFrame d("treename", "file.root");  
auto h = d.Filter(IsGoodEntry, {"x", "y"})  
    .Histo1D("x");
```

- full control over *the analysis*
- no boilerplate
- common tasks are already implemented
- parallelisation is automatic

C++ / JIT / PyROOT

C++ and just-in-time compiled code

```
d.Filter("th > 0").Snapshot("t","f.root","pt*");
```

PyROOT -- just leave out the `;

```
d.Filter("th > 0").Snapshot("t","f.root","pt*")
```

The screenshot shows the official website for ROOT. The header features the CERN logo and the text "ROOT Data Analysis Framework". Below the header, a large banner with the text "ROOT: analyzing petabytes of data, scientifically." and a subtext "An open-source data analysis framework used by high energy physics and others." includes links for "Learn more" and "Install v6.24/04". To the right of the banner is a 3D visualization of a particle detector simulation. Below the banner are four navigation icons: "Get Started" (a book icon), "Reference" (a book icon), "Forum & Help" (a speech bubble icon), and "Gallery" (a bar chart icon). At the bottom, there are two sections: one with a "v-1" icon and text about the software's capabilities, and another with a "\$_" icon and text about its open-source nature and integration with Python.

v-1

ROOT enables statistically sound scientific analysis and visualization of large amounts of data: today, more than 1 exabyte (1,000,000,000 gigabyte) are stored in ROOT files. The Higgs was found with ROOT!

\$ _

As high-performance software, ROOT is written mainly in C++. You can use it on Linux, macOS, or Windows; it works out of the box. ROOT is open source: use it freely, modify it, contribute to it!

ROOT comes with an incredible C++ interpreter, ideal for fast prototyping. Don't like C++? ROOT integrates super-smoothly with Python via C++ binding. Or what about using ROOT in a Jupyter notebook?
